

Instructions for installing Script

Hosi_Demucs_Separator_Gui.lua AI Music Separator (Demucs) for REAPER

Welcome to the tutorial for installing the AI music separator (Demucs) directly in REAPER. This script was created to help producers easily separate parts of a track (vocals, drums, bass, etc.) quickly and efficiently through an intuitive interface.

Please follow each step carefully.

Part 1: Environment Setup (Required - Only do it once)

The following steps are required for the script to work.

Step 1: Install Python (Version 3.11)

To ensure the highest compatibility with AI libraries, we will use Python version 3.11.

1. Download: Visit the official Python download page:
<https://www.python.org/downloads/release/python-3119/>
2. Scroll down and find the "Windows installer (64-bit)" file
.
3. Installation (Very important): Run the installation file. On the first screen, make sure you have checked the "Add python.exe to PATH" box before pressing "Install Now".

Step 2: Install FFmpeg

Demucs needs FFmpeg to process audio files.

- Windows: Download FFmpeg from [gyan.dev](https://www.gyan.dev/ffmpeg/builds/) (choose the "release essentials" version), unzip and add the bin folder to your system PATH.
- macOS: Open Terminal and run the command `brew install ffmpeg`.

Step 3: Install Demucs and AI Libraries

1. Open Command Prompt or Terminal.
2. Install Demucs: Run the following command:
`pip install -U demucs`
3. Installing the Sound Library (Important): To avoid the error of not being able to create a file after processing, run the following command:
`pip install --force-reinstall torch torchaudio soundfile`

Step 4: Install GPU Environment (Optional)

NVIDIA graphics card and want faster processing, follow these steps. Otherwise, skip to Step 5.

1. Install NVIDIA CUDA Toolkit:
 - Visit NVIDIA's download page:
<https://developer.nvidia.com/cuda-12-1-0-download-archive>
 - Select the following options: Windows > x86_64 > 11 (or 10) > exe (local).
 - Download and run the installation file. Select the Express (Recommended) option .
2. Install PyTorch GPU version: Open Command Prompt and run the following command:
`pip install --force-reinstall torch torchvision torchaudio --index-url https://download.pytorch.org/whl/cu121`
3. Update Graphics Card Drivers: Make sure you're using the latest NVIDIA driver version by updating via GeForce Experience or downloading from the NVIDIA website.
4. Restart your computer: This step is required for the system to fully recognize the CUDA environment.

Step 5: Install the Interface Library (RealmGui)

1. In REAPER, go to menu Extensions > ReaPack > Browse packages....
2. In the Filter box, type RealmGui.
3. Find the package named "RealmGui: ReaScript binding for Dear ImGui" , right click on it and select Install/update .
4. Click the Apply button and wait for the installation to complete.
5. Restart REAPER.

Part 2: Installing and Using the Script

Setting

1. Open REAPER, go to Actions > Show action list....
2. Click New action... > Load ReaScript.
3. Load the downloaded script
Hosi_Demucs_Separator_Gui.lua .

Use

1. Save Project: Make sure you save your REAPER project.
2. Run Script: Open Action List (? key), find the script you just created and press Run .
3. Options Window: A window will appear for you to select AI Model and Processing Device (CPU/GPU).
4. Start Separating Music: Select a single audio item and press the "Run Separation" button .
5. Check the results: Once finished, the split stems will be automatically imported into new tracks in your project.

Wishing you productive and creative music production experiences!
